Final Project

For my final project, I wanted to use a website to present my favorite Taiwanese eats!

This project was created with AWS Amplify which hosts a static react website. I chose Amplify because the tool is fully manageable and can ease continuous deployment as it is synced up with my GitHub repo containing react code. It also leverages AWS CloudFront and AWS S3 to deliver site assets through the AWS Content Delivery Network.

Although I have very little web development experience, I was still able to create this beautiful react app that features a spinning log component, hyperlinks to recipes, and beautiful images of these foods. I hope you enjoyed!
